Questions for Panel:

- Does it appear that windows of susceptibility are involved?
- What classes of exposure might be involved and should be targeted?
- What tools could facilitate study? (iPS; organ-simulating devices, animal models?.
- Can existing stocks of cells/tissues be leveraged for environmental health studies?
- Is the “source of cells” important to consider in the study? Young vs. old; history of exposure.
- Which of the models/technologies (e.g. described yesterday) could be generalizable to multiple disease (or health) entities or exposures?
