Session 5 Panel Discussion: Community Perspectives on Bridging New Science with Decision Making

1. How do understandings of (differential) individual susceptibility depend on or concern endogenous/biological factors?
2. What are the implications of endogenous/biological variability in individual susceptibility for risk management and decision making?
3. What are the implications of endogenous variability and perceptions thereof for risk communication?
   a) Do more susceptible individuals want or need different information than others?
   b) Are there implications of differential individual susceptibility for source credibility or communication strategies, for example analogous to genetic counseling?
